
Nutrients on land
food for agents; spreads 2%
a tick to each land neighbour
eating
up to 4 a tick, shared in crowds
Agent bodies
up to 150 energy each
split in two at reproduction
erosion
0.2% of bank
nutrients a tick
silt
1% of the load
a tick, x2.5
in spring
metabolism and death
0.5 resting, 0.9 moving, +25% at night,
+0.05 to speak; whole bodies at death
River load
nutrients in the water
a closed loop, flowing south
decomposition
5% a tick in forest, 3.5% in clearings,
x1.2 in spring down to x0.4 in winter
Detritus
waste and bodies, where they fell;
a fire turns the nutrients it burns
into detritus too
each tick 20% of every stretch's load
moves one row south
Total = nutrients + bodies + detritus + river load
= 30,000, asserted after every tick
